

ABSTRACT OF THE DISCLOSURE

A system and method of identifying and allocating translation services in response to a user's request for a particular translation work experience. The system and method of the invention is configured to put a user having a translation request in contact with a candidate translation service via a moderator. The method of the present invention includes registering a plurality of translation services with the moderator via a website. Each translation service creates and provides the moderator with contact information and one or more translator records each having a series of free fields operable to receive data indicative of a working experience of the translator. Upon receiving a user's translator request, the moderator matches the user's request with the free fields in each of the stored translator records. The moderator provides the user with a display of the best candidate translator records having the desired translation work experience.
